POINT OF VIEW

AgenticOps

The radar's conclusion on this technology: what Tata Communications should do, why, and what's still missing.

Tech Lens · Point of View · Written Oct 4 · assessed Sep 11 from 6 pages · version 4

> Monitor AgenticOps; evidence shows promising fit, but not enough market, adoption or TCL-specific evidence to justify investment.

RECOMMENDATION

Monitor; do not invest yet. The fit is promising, but the evidence is Cisco's own launch material and does not establish TCL-specific demand, production adoption or delivery economics. Reconsider a controlled Cloud or Network pilot if at least 1,000 organizations are independently confirmed as using Cloud Control in production, or if at least 10 non-Cisco integrations are generally available and used in production; a repeatable median investigation time below 30 minutes across at least 10 production workflows would also strengthen the case.

SUMMARY

AgenticOps uses AI agents, operational context and governed workflows to diagnose, triage and resolve cloud and network issues. The evidence shows early commercial activity and broad operational use cases, but all six pages are Cisco's own blog announcements and cover a narrow launch period. AgenticOps fits both the Cloud and Network fabrics, while TCL-specific portfolio, customer and delivery evidence is missing. TCL should monitor the technology and test the evidence before committing investment.

SCORES

FABRIC	MARKET	STRATEGIC	ADOPTION	PRIORITY	HORIZON
Cloud	4.5 2/3	8 1/3	no score 0/3	not set	not set
Network	4.5 2/3	8 1/3	no score 0/3	not set	not set

Not assessed in Interaction or IoT: judged not relevant to this technology before scoring.

Out of 10, darker when higher. 2/3: two of the score's three measures had enough evidence. With none there's no score, which isn't a zero.

MARKET POTENTIAL

Measures: Addressable market · Growth · Use-case breadth

Market Potential scored 4.5 out of 10 in both the Cloud and Network fabrics, but only from growth and use-case breadth; addressable market could not be assessed from the evidence. Growth shows early expansion activity, including more than 300 onboarded customers, a waitlist exceeding 5,000 and several new offerings, while use-case breadth shows related diagnostics, triage, remediation, proactive detection and governed automation across cloud and network operations. The evidence is concentrated in Cisco announcements and does not establish industry-wide growth or broad utility across TCL fabrics and industries.

STRATEGIC FIT

Measures: Fabric fit · Portfolio adjacency · Right to play

Strategic Fit scored 8 out of 10 in both the Cloud and Network fabrics, but only for fabric fit; portfolio adjacency and TCL's right to play could not be assessed from the evidence. AgenticOps fits Cloud through governed agents, shared infrastructure context, integrations and reusable workflows across networking, security and cloud infrastructure, and fits Network through controller-based diagnostics, telemetry, topology, remediation and network assurance. The evidence is primarily Cisco marketing and does not independently establish broad production adoption or measurable outcomes for TCL's portfolio or services.

ADOPTION READINESS

Measures: Maturity (TRL) · Commercial adoption · Deliverability

Adoption Readiness could not be assessed from the evidence in either fabric. Maturity would need dated, independent production deployments or field trials; commercial adoption would need named paying customers, procurement evidence or revenue disclosure; and deliverability would need detailed carrier-scale deployment evidence covering skills, costs, timelines, integration, reliability and regulatory constraints.

OTHER MEASURES

Not part of the three scores: Disruption threat · Serviceable capture · Capability gap

The evidence does not establish a disruption threat or serviceable capture in either fabric, so neither could be assessed from the evidence. The capability gap appears relatively small because the required foundations include telemetry, inventory, topology, identity, permissions, controllers, integrations and governed workflows, many of which Cisco already provides; TCL would still need to validate or build equivalent multi-cloud, multi-vendor, carrier-scale and regional capabilities, or obtain them through partners. Cisco's evidence does not prove that this capability gap would remain small for TCL's environments.

PRIORITY AND HORIZON

No priority could be set yet in either fabric because how soon was unavailable: none of the two inputs for maturity and commercial adoption could be assessed. How big was rated 4, mid, from only one of four inputs in each fabric, while addressable market, disruption threat and serviceable capture could not be assessed; therefore no horizon was set.

EVIDENCE GAPS

Cloud

- A dated production deployment with named paying customers in cloud operations would show maturity and commercial adoption beyond Cisco's launch claims.
- A TCL portfolio and customer assessment covering multi-cloud, security, observability, ITSM integration, delivery skills and buyer demand would show whether TCL has a credible right to play.
- An independent, dated market estimate for AgenticOps or comparable cloud, network and security operations spend would show the size of the opportunity.

Network

- Named customer or operator deployments with production results would show whether AgenticOps is ready for carrier-scale network operations.
- A TCL assessment of network controllers, telemetry, topology, automation, installed base, channels and managed-service capability would show where TCL could compete.
- Independent market and customer-spend evidence for agentic network operations would show whether the opportunity extends beyond Cisco's ecosystem.

METRICS TO WATCH

What would change the verdict, suggested by the assessment. Nothing tracks them automatically: the next assessment checks them.

Organizations actively onboarded to Cisco Cloud Control

should rise ↑

Now: More than 300 organizations were onboarded by August 25, 2026; this is Cisco-reported launch data, not an independently audited customer count source ↗

Threshold: At least 1,000 organizations using Cloud Control in production, with the count independently confirmed through customer references or procurement records

If crossed: Commercial adoption would be established beyond early launch users, so TCL should assess a controlled AgenticOps pilot rather than treat it as only a vendor concept

Live non-Cisco integrations available in Cloud Control

should rise ↑

Now: Four non-Cisco integrations were named as connected at launch: ServiceNow, BlueCat, Infoblox, and Atlassian; Cisco also announced more than 60 broader integration commitments on August 25, 2026 source ↗

Threshold: At least 10 non-Cisco integrations are generally available and used in production across ITSM, DNS/IPAM, monitoring, and collaboration systems

If crossed: AgenticOps would have enough cross-domain reach to coordinate real operational workflows, making interoperability and governance testing worthwhile for TCL

Time required to complete a recurring operational investigation

should fall ↓

Now: Cisco reported that one early user reduced a recurring investigation from more than 10 hours to under 10 minutes by August 25, 2026; this is a single vendor-reported example source ↗

Threshold: The median investigation time falls below 30 minutes across at least 10 production workflows and is verified by customer-maintained timestamps

If crossed: A repeatable productivity gain would be demonstrated, supporting a business case for AgenticOps in operations teams rather than relying on isolated proof-of-concept results

---

Reusable governed AgenticOps workflows deployed by customers

should rise ↑

Now: Cisco Cloud Control included Agentic Workflows and Cloud Control Studio at U.S. general availability on August 25, 2026, but the evidence reports no customer deployment count source ↗

Threshold: At least 25 customer-created workflows execute production remediation or investigation tasks with logged approvals, permissions, and rollback outcomes

If crossed: Customers would be encoding and reusing operational expertise under governance, indicating that AgenticOps is becoming an operating model rather than an assistant interface

HOW THE SCORES WERE DERIVED

Each score is the weighted mean of its scored measures. Expand a measure for the assessor's justification, verbatim.

Cloud

Market Potential 4.5 weighted mean · 2 of 3 measures scored

- Addressable market ×0.4 no score

  Not enough evidence. Would need: An analyst or primary-source market figure giving the global AgenticOps or comparable cloud/network/security operations market size or annual spend, with clearly stated scope and publication date; ideally supported by more than one independent estimate or by segmentation showing the portion addressable by AgenticOps.

  Counter-case: The broad integration strategy, Cisco's installed base of more than 13,000 ACI organizations, and early Cloud Control onboarding suggest a potentially large opportunity across cloud operations and security. However, these indicators do not establish the size of the addressable market or support a 0–10 market score.

- Growth ×0.3 4

  The dossier shows repeated near-term expansion activity: Cisco launched Cloud Control general availability with more than 300 customers onboarded and a 5,000-plus waitlist, expanded integrations and marketplace capabilities, and then announced multiple AgenticOps-enabled AI infrastructure and networking offerings. This supports growing commercial activity and early deployment, but not steady industry-wide growth at the mid anchor: the evidence covers only one vendor, a narrow 2026 window, and provides no funding trend, independent adoption series, or evidence of multiple new entrants.

  Counter-case: The strongest argument for a lower score is that nearly all evidence is Cisco promotional material from a single launch period. The 300 onboarded users and waitlist are vendor-reported, while the other documents describe product positioning and planned offerings rather than independently verified deployments or market expansion.

- Use-case breadth ×0.3 5

  The dossier supports a family of related Cloud/IT-operations use cases rather than a single narrow one: agent-assisted network diagnostics, incident triage, issue resolution, automated recurring investigations, proactive detection of network issues before user reports, and governed automation of repetitive runbook tasks. Cisco also describes cross-product operational coordination using shared identity, inventory, topology, alerts, permissions, and product context. This is meaningful breadth within the Cloud, hosting, and security fabric, but the evidence does not establish broad horizontal utility across multiple TCL fabrics or industries.

  Counter-case: Most named uses are variations of network and IT-operations management, and the evidence is primarily Cisco product marketing. The dossier provides limited independent validation and does not demonstrate distinct use cases

> *across multiple industries or TCL fabrics, so a score above the mid anchor would be difficult to support.*

Strategic Fit 8 `weighted mean · 1 of 3 measures scored`

Fabric fit `×0.4` 8

AgenticOps fits the Cloud fabric at a core operational layer: Cisco Cloud Control uses AI agents, governed access, live infrastructure context, integrations, and reusable workflows for diagnostics, triage, issue resolution, and automation across networking, security, and cloud infrastructure. The dossier specifically names AgenticOps in Nexus One data-center networking, including agentic diagnostics and remediation through controller APIs, and in Secure AI Factory deployments spanning networking, security, observability, sovereign clouds, and cloud providers. This directly upgrades cloud hosting, multi-cloud infrastructure management, and cloud-delivered security services, although the evidence is primarily vendor-reported and does not establish broad independent adoption.

Counter-case: The evidence is concentrated in Cisco announcements and product marketing, and AgenticOps may primarily be an operational overlay rather than a distinctive cloud, hosting, or security service. The dossier does not independently verify the claimed automation results or demonstrate deployment across multiple providers and SASE or zero-trust environments.

Portfolio adjacency `×0.3` `no score`

Not enough evidence. Would need: Evidence of TCL's current Cloud-fabric portfolio: multi-cloud connectivity and hosting infrastructure, edge or PoP footprint, SASE/zero-trust and security platforms, sovereign-cloud capabilities, observability/telemetry systems, ITSM and automation integrations, relevant engineering skills, and enterprise or managed-service distribution capabilities.

Counter-case: TCL may operate network, cloud, hosting, security, enterprise-integration, or managed-service assets that would provide meaningful adjacency, but none are evidenced in the dossier.

Right to play `×0.3` `no score`

Not enough evidence. Would need: Evidence naming TCL as the provider or implementation partner; named current buyers and deployments; evidence of who those buyers purchase AgenticOps from today; and documented buying criteria such as carrier-grade support, security and compliance certifications, multi-cloud integration, operational outcomes, geographic/regulatory coverage, and customer references.

> *Counter-case: TCL could potentially earn a mid-level position through partnerships, managed cloud/security services, or an anchor customer, especially because the dossier identifies enterprise, neocloud, and sovereign-cloud demand and emphasizes integration, security, compliance, and operational support. But that possibility is not evidence of TCL's credibility.*

Adoption Readiness `no score` `weighted mean · 0 of 3 measures scored`

Commercial adoption `×0.4` `no score`

Not enough evidence. Would need: Named paying customer deployments in the Cloud fabric, disclosed AgenticOps or Cloud Control revenue, procurement announcements, or operator/customer references confirming production use and whether the 300-plus onboarded organizations are paying customers.

Counter-case: The 300-plus onboarded organizations and 5,000-plus waitlist indicate meaningful early market interest and could support a mid-range score if the onboarding is confirmed as paid production use.

Deliverability `×0.2` `no score`

Not enough evidence. Would need: Independent, detailed case studies of carrier-scale deployments specifying required engineering skills and staffing, capex and recurring costs, implementation and migration timelines, supported scale and availability, operational dependencies and failure-handling, multi-cloud integration effort, and applicable regulatory or sovereignty constraints.

Counter-case: The platform is generally available in the U.S., has more than 300 onboarded customers, connects multiple Cisco and third-party products, and provides governed workflows and validated infrastructure services. These facts suggest a path toward operational delivery, but they do not establish carrier-grade delivery difficulty or independent production performance.

Maturity (TRL) `×0.4` `no score`

Not enough evidence. Would need: Independent dated evidence of AgenticOps deployments or field trials—such as named customer case studies with verifiable operational results, third-party validation, or independently documented production use at scale—is needed to assign a TRL score.

Counter-case: General availability, reported customer onboarding, concrete usage examples, and integrations could indicate a productised technology at least at mid-to-high maturity if independently corroborated.

Other measures

Capability gap 8

Delivering AgenticOps in the Cloud fabric requires unified telemetry, inventory and topology, identity and permissions, governed agent actions, workflow automation, integrations across infrastructure and ITSM tools, and underlying cloud/network/security controllers. The dossier shows Cisco already operates most of

> these capabilities: Cloud Control is generally available, unifies operational context and permissions, provides AI Canvas, custom agents, reusable workflows and guardrails, and connects Cisco products with ServiceNow, BlueCat, Infoblox and Atlassian. Cisco also operates the relevant networking, security, observability, multi-site and AI-infrastructure portfolio, including Nexus/ACI, Meraki, secure routing, AI Defense and validated cloud/AI infrastructure. This indicates a relatively small capability gap, mainly in scaling integrations, autonomy, regional availability and proving outcomes. No hiring or acquisition signal is provided; the evidence instead shows productization and partner expansion.
>
> *Counter-case: The evidence is almost entirely Cisco marketing, and Cloud Control is only generally available to U.S. customers with capabilities dependent on connected Cisco products, subscriptions, permissions and region. The dossier does not independently demonstrate broad multi-cloud, sovereign-cloud or cross-vendor operational coverage, nor does it establish the depth of production adoption. If those requirements are material, the remaining gap could be substantially larger than the score suggests.*

- Disruption threat `no score`

  > *Not enough evidence. Would need:* Evidence that AgenticOps is replacing a specific TCL cloud, hosting, or security service or revenue line—for example, named customer deployments or pilots that displaced TCL-managed operations, multi-cloud connectivity, edge, SASE/zero-trust, sovereign-cloud, or cloud-security services; or credible competitor/customer evidence showing such substitution is already occurring.
  >
  > *Counter-case: Cisco Cloud Control is generally available, has customer onboarding and integrations across network and IT operations, and may evolve into a platform that reduces demand for manual managed operations or fragmented monitoring tools. That indicates commercial traction, but not demonstrated substitution of TCL revenue.*

- Serviceable capture `no score`

  > *Not enough evidence. Would need:* Evidence mapping the AgenticOps cloud opportunity by customer segment and geography, including market size or addressable demand, TCL's existing enterprise/customer base and channels in those segments and regions, relevant delivery and partner assets, and evidence of TCL's ability to compete or win share against incumbent providers.
  >
  > *Counter-case: The U.S. general availability, more than 300 onboarded customers, global waitlist, and stated enterprise, neocloud, and sovereign-cloud targets could indicate a definable opportunity, but they do not identify TCL's addressable segments, geographic reach, or competitive position.*

Network

Market Potential 4.5 weighted mean · 2 of 3 measures scored

Addressable market ×0.4 no score

Not enough evidence. Would need: A dated analyst or primary market figure quantifying the addressable annual spend or revenue opportunity for agentic network operations/AgenticOps, with scope clearly defined (for example, enterprise network-management software and services, geographic coverage, and whether adjacent observability, automation, or managed-networking spend is included). Independent adoption or customer-spend evidence would also strengthen the estimate; one TAM figure alone would be thin support.

Counter-case: The breadth of Cisco's networking footprint, Cloud Control integrations, and AgenticOps positioning suggests a potentially large opportunity across enterprise network operations, but the dossier supplies no market figure to establish whether it is niche, billion-dollar scale, or category-reshaping.

Growth ×0.3 4

The dossier shows early expansion signals for AgenticOps in networking: Cisco announced Cloud Control general availability on 2026-08-25 with more than 300 customers onboarded, a waitlist exceeding 5,000, over 60 integration commitments, and reusable agent/workflow tooling. Cisco also made multiple dated August-September announcements connecting AgenticOps to Nexus One, AI networking, validated rack-scale infrastructure, and broader network-management offerings. This supports emerging platformization and initial deployments, but not high growth across the space.

Counter-case: All evidence comes from Cisco promotional materials, several announcements are closely clustered or overlapping, and the dossier provides no independent adoption data, funding series, competing entrants, hyperscaler deployments, or evidence that growth extends beyond Cisco's ecosystem. The 300 onboarded customers and 5,000-person waitlist are self-reported and do not establish broad market growth.

Use-case breadth ×0.3 5

The dossier supports a family of distinct network-operations uses within the Network fabric: network fault investigation and diagnostics; incident triage; issue resolution/remediation; proactive identification of network issues before users report them; automation of repetitive operational tasks and runbooks; unified operations across inventory, topology, alerts, permissions, and product context; and AI-assisted network assurance, including self-managing Wi-Fi. This is broader than a single narrow use case but remains concentrated on network and infrastructure operations rather than broad utility across multiple fabrics or industries.

Counter-case: The strongest case for a lower score is that diagnostics, triage, resolution, and proactive detection may be stages of one incident-management workflow, while the evidence is largely Cisco product marketing. Independent

> *evidence of deployed breadth beyond Cisco-centric network operations is limited.*

Strategic Fit 8 `weighted mean · 1 of 3 measures scored`

Fabric fit `×0.4` 8

AgenticOps fits the Network fabric strongly because the dossier describes concrete network uses: AI agents operating through Nexus controller MCP APIs for diagnostics, triage, and issue resolution; unified topology, telemetry, alerts, permissions, and operational state; and AI-driven network assurance beyond SNMP monitoring. These capabilities directly enhance network management, observability, automation, and SDN/controller-based services that a connectivity fabric provides. The fit is strong but not a 9–10 because the evidence is primarily Cisco marketing and does not independently demonstrate broad production adoption or measurable network-service outcomes.

Counter-case: AgenticOps is primarily an operational-management layer rather than connectivity infrastructure itself, and the dossier provides limited independent evidence that it is deployed broadly in carrier, edge, subsea, satellite, or managed connectivity services. The strongest network claims are vendor assertions.

Portfolio adjacency `×0.3` `no score`

Not enough evidence. Would need: Evidence describing TCL's current Network-fabric assets and capabilities relevant to AgenticOps, including core/edge/PoP infrastructure, network controllers and APIs, telemetry and observability systems, inventory/topology data, automation or SDN/NFV platforms, enterprise-management integrations, and operational skills or runbooks.

Counter-case: TCL may already operate connectivity infrastructure, network-management platforms, telemetry systems, enterprise integrations, or automation skills that could support AgenticOps, but the dossier does not substantiate any such TCL assets.

Right to play `×0.3` `no score`

Not enough evidence. Would need: Named or independently documented buyers and deployments; evidence of who those buyers purchase AgenticOps or comparable network-operations services from today; and buyer-validated criteria such as carrier-grade reliability, global reach, regulatory or data-sovereignty requirements, managed-service capability, integration requirements, and reasons buyers would select TCL over Cisco, hyperscalers, network vendors, or incumbent carriers.

Counter-case: The claimed customer base, broad integration ecosystem, and targeting of sovereign clouds and enterprises could indicate that AgenticOps is becoming a serious enterprise networking capability. A carrier such as TCL might gain credibility through partnerships or managed-network deployments, but no such TCL-specific evidence is provided.

Adoption Readiness `no score` `weighted mean · 0 of 3 measures scored`

Commercial adoption `×0.4` `no score`

Not enough evidence. Would need: Named customer deployments of AgenticOps or Cisco Cloud Control in production network operations, customer or operator procurement announcements, or revenue disclosures attributable to the offering.

Counter-case: The reported 300 onboarded customers and concrete early-user workflow results could indicate commercial adoption beyond a concept, but the claims are vendor-reported and insufficiently specific to establish identifiable paying customers or repeatable production purchasing.

Deliverability `×0.2` `no score`

Not enough evidence. Would need: Documented carrier-grade deployments showing required engineering skills and staffing, capex and licensing costs, deployment and integration timelines, operational dependencies and support model, scale and availability results across network fabrics, and any applicable regulatory or regional deployment constraints.

Counter-case: General availability, existing Cisco ACI adoption, 300-plus Cloud Control onboardings, pre-validated infrastructure services, and integrations with operational systems suggest that the technology may be deliverable with established vendor support and known engineering patterns.

Maturity (TRL) `×0.4` `no score`

Not enough evidence. Would need: Independent, dated evidence of AgenticOps production deployments or field trials operating network-fabric infrastructure, with documented results, or a ratified standard covering the relevant agentic network-operations capabilities.

Counter-case: Cisco's reported general availability, customer onboarding, and claimed operational results could indicate at least mid-level maturity, but the dossier does not independently substantiate those claims and the technology's network-fabric scope is not demonstrated in detail.

Other measures

Capability gap 8

The capability gap appears small for the Network fabric. Delivering AgenticOps requires rich network telemetry, centralized controllers, APIs, topology and inventory data, policy enforcement, multi-vendor integrations, governed permissions, reusable workflows, and AI-agent execution with human guardrails. The dossier shows Cisco already operates the relevant foundation: ACI has segmentation, service chaining, APIs, controller-based management and observability; Nexus One extends this across VXLAN EVPN, NX-OS, SONiC and Hyperfabric; and Cisco Cloud Control is generally available with AI Canvas, MCP-based controller access, Agentic Workflows, Studio, Marketplace, identity, inventory, topology, alerts and permissions. It also reports 300 customers onboarded and integrations with ServiceNow, BlueCat, Infoblox and Atlassian. Cisco's

networking portfolio therefore substantially overlaps the required fabric and operational capabilities. The score is below 10 because the evidence is primarily vendor marketing, broad agent autonomy and heterogeneous-fabric operations are not independently demonstrated, and no hiring or acquisition signals are provided.

Counter-case: The strongest argument for a lower score is that the dossier demonstrates product positioning and early onboarding rather than proven production-scale AgenticOps. Key claims about autonomous diagnostics, cross-fabric policy enforcement, live workload mobility and operational outcomes are vendor assertions, while independent evidence of reliability, safety, customer deployment depth and the cost of closing remaining integration and governance gaps is absent.

- Disruption threat `no score`

  Not enough evidence. Would need: Evidence that AgenticOps has replaced an incumbent connectivity, network-management, or managed-service offering at customers relevant to TCL—for example, named customer deployments or pilots showing displaced provider services, reduced managed-network spend, or competitor sales explicitly positioned as substitutes for those services.

  Counter-case: Cisco Cloud Control's customer onboarding and automation claims could indicate that agentic operations will reduce demand for manual network-management or managed-service work, but the dossier does not establish that this is occurring or affecting TCL revenue.

- Serviceable capture `no score`

  Not enough evidence. Would need: Evidence defining the addressable market for AgenticOps in the Network fabric by customer segment and geography, plus TCL's relevant channels, installed base, partnerships, delivery capabilities, and geographic footprint against those segments.

  Counter-case: Cisco's stated 13,000-plus ACI organizations, 300 Cloud Control customers, and more than 5,000 global waitlist sign-ups could indicate a substantial enterprise networking market, but they do not establish TCL's ability to win any defined portion of it.
